Detailed findings

INFO [API] Scanned 37 API route files

Automated static checks for admin auth and request validation are complete.

INFO [Data consistency] Cache and admin UI refresh (static)

Found revalidate* helpers in 17 of 37 API route files. Mutating handlers present in ~28 (approximate).

Fix: After admin mutations, call revalidateAdminViews or targeted revalidatePath to avoid stale RSC or list data.

INFO [Data consistency] Centralized admin payment UI module exists

admin-payment-ui helps keep status badges and action rules consistent across finance pages.

INFO [Database] In-memory (mock) database mode

USE MOCK_DB is enabled. Production data integrity and indexing cannot be verified against Postgres.

Fix: Run audits against a staging environment with DATABASE_URL to validate real database behavior.

INFO [Database] No duplicate lowercased player names in current data

Roster has 9 player record(s) without obvious name collisions in this check.

INFO [Functional] Key workflow files present (static check)

This audit does not execute E2E browser tests; it verifies critical modules exist on disk.

INFO [Performance] NPM production dependencies: 22

Large dependency sets increase install surface and can affect cold start. Review for unused packages periodically.

LOW [Performance] Large page/component file

~963 lines — may slow compile and be harder to optimize. Consider splitting or lazy-loading subviews.

File: `src/app/admin/content/editors/home-editor.tsx`

LOW [Performance] Large page/component file

~849 lines — may slow compile and be harder to optimize. Consider splitting or lazy-loading subviews.

File: `src/app/admin/content/editors/gallery-editor.tsx`

LOW [Performance] Large page/component file

~759 lines — may slow compile and be harder to optimize. Consider splitting or lazy-loading subviews.

File: `src/app/admin/finance/transactions/page.tsx`

LOW [Performance] Large page/component file

~725 lines — may slow compile and be harder to optimize. Consider splitting or lazy-loading subviews.

File: `src/app/register/page.tsx`

LOW [Performance] Large page/component file

~694 lines — may slow compile and be harder to optimize. Consider splitting or lazy-loading subviews.

File: `src/app/admin/players/[id]/page.tsx`

MEDIUM [Security] HTML injection risk (dangerouslySetInnerHTML)

Component sets raw HTML without an obvious DOMPurify / sanitizer in the same file.

File: `src/components/news/NewsPostHtml.tsx`

Fix: Sanitize HTML with DOMPurify (or avoid raw HTML) before rendering.

HIGH [Security] Dynamic code execution pattern

Source contains `eval()` or `new Function()` which can be unsafe if user-controlled input reaches it.

File: `src/lib/audit/modules/security.ts`

Fix: Remove dynamic execution or strictly sandbox and validate all inputs.

INFO [UI/UX] Admin UI accessibility (heuristic)

Scanned 76 admin-related source files. 16 files reference ARIA, 14 use `role=`, 27 mention buttons (coarse string match).

Fix: Prefer labels for inputs, focus states for modals, and test keyboard navigation on critical flows.

Recommendations

- Treat Critical/High items before release; schedule Medium in the next sprint.
- Re-run this audit after major finance or security changes; add E2E tests for payment and invoice flows.
- Complement with `npm audit`, Playwright e2e, and hosted DB backups for production readiness.
